

# Welcome to Gesture

An exploration of 2D and 3D gesture recognition

Ben Alun-Jones

# What is Gesture?

- Gesture is a three-dimensional realtime visualisation
- Gesture is a collaborative environment
- Gesture is human motion

# What is a gesture?

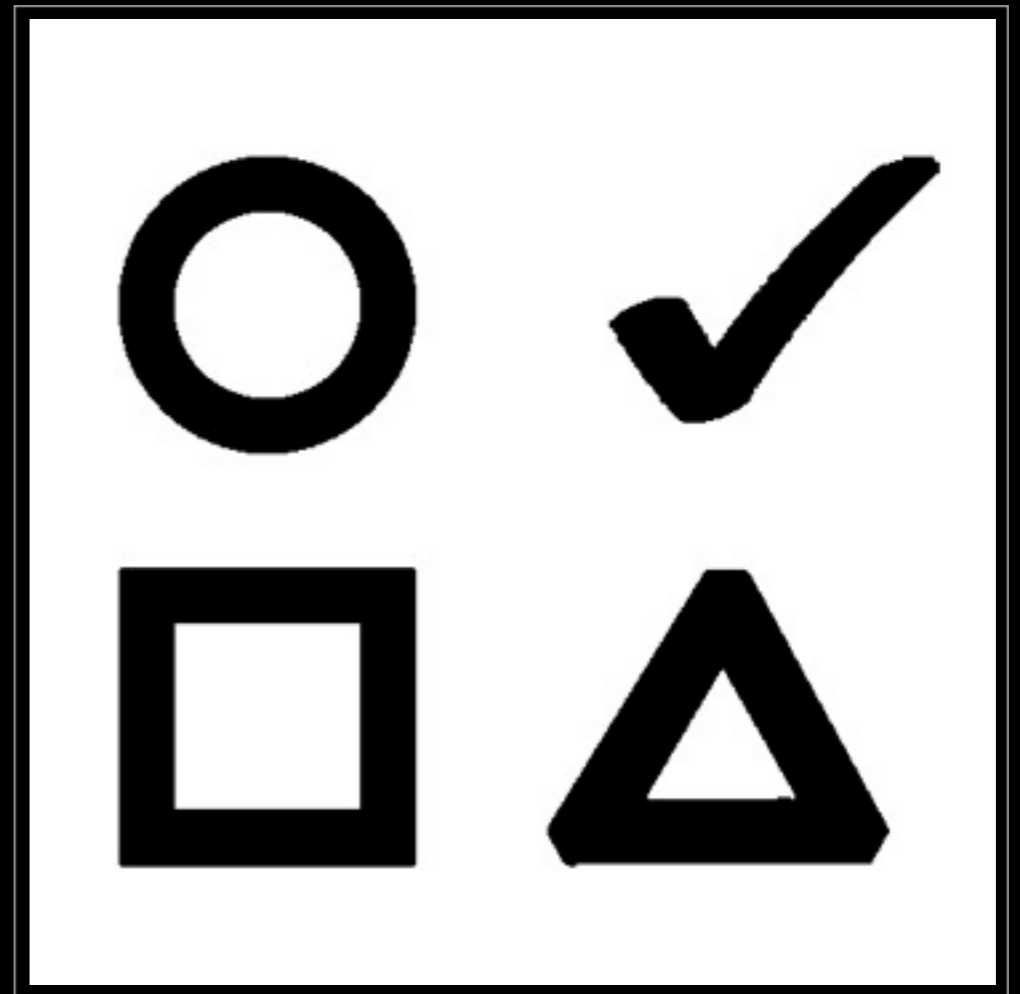

- A non-verbal signal that relates information through motion or expression.

# How do you recognise gestures?

- Machine Learning
- Template Matching
  - "\$1 recognizer"
  - "\$3 recognizer"

# Selecting gestures

- Templates mean that almost any gesture can be recognised
- But gestures denote meaning, so which ones to choose?
  - Even geometric shapes present challenges

# Results of gesture recognition methods "in the wild"

\$1 Recognizer - Recognising gestures on the touchscreen

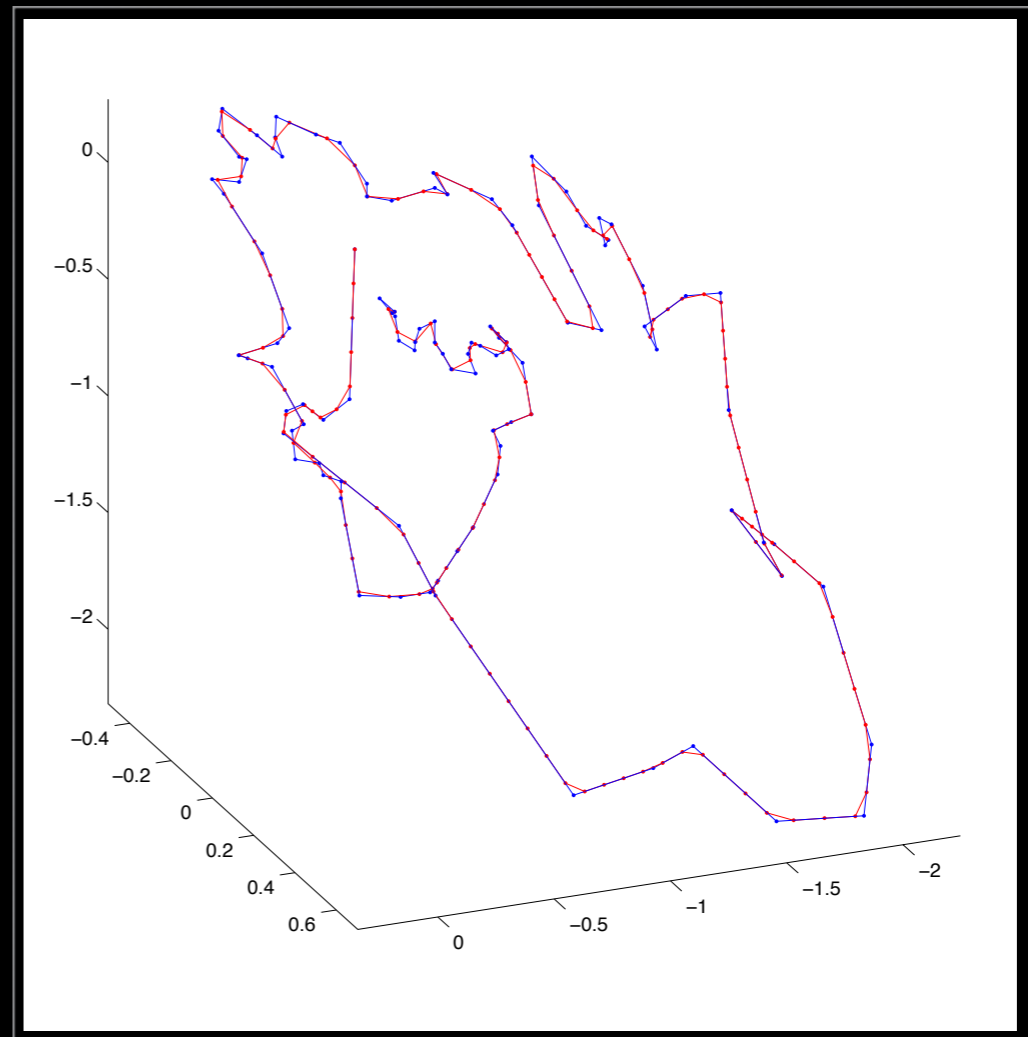

# Results of gesture recognition methods "in the wild"

\$3 Recognizer - recognising gestures using the accelerometer

# What do gestures look like?

- iPhone accelerometer data of a circle gesture

# Time and Motion Studies

Frank and Lilian Gilbreth

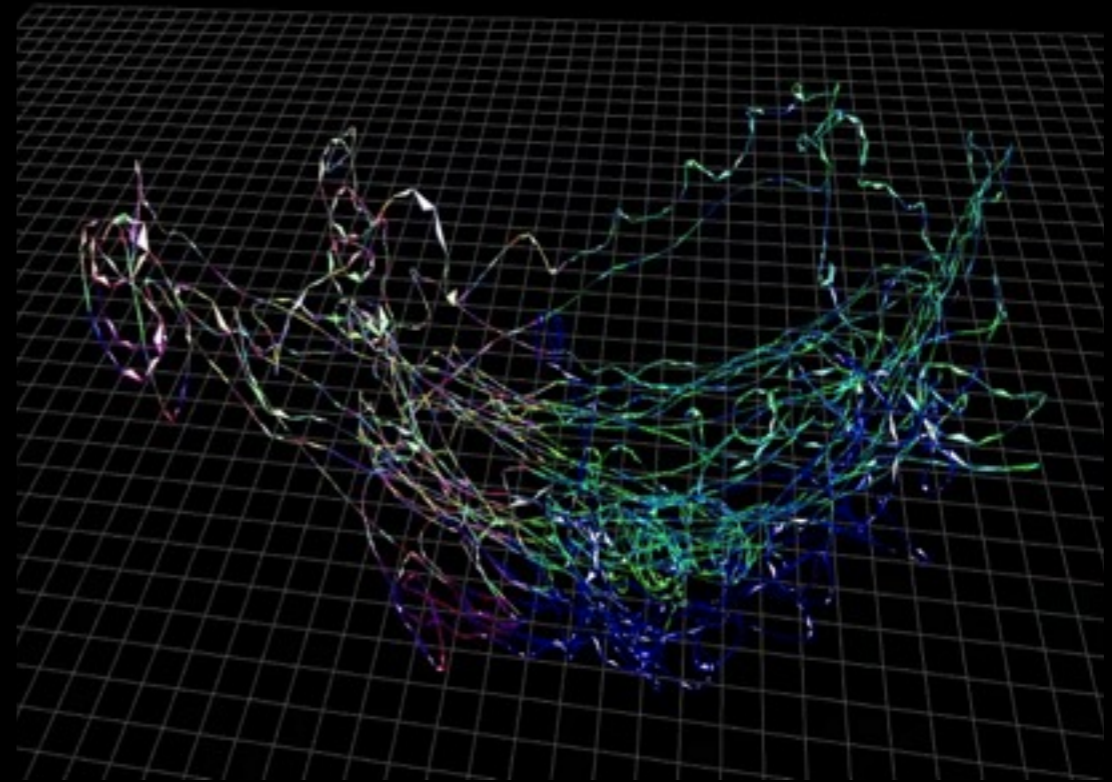

# Early Attempts

- Difficult to perceive depth
- Colours did not relate as hoped

# Improvements

- Added grid to provide depth cues
- Changed line structure to represent acceleration

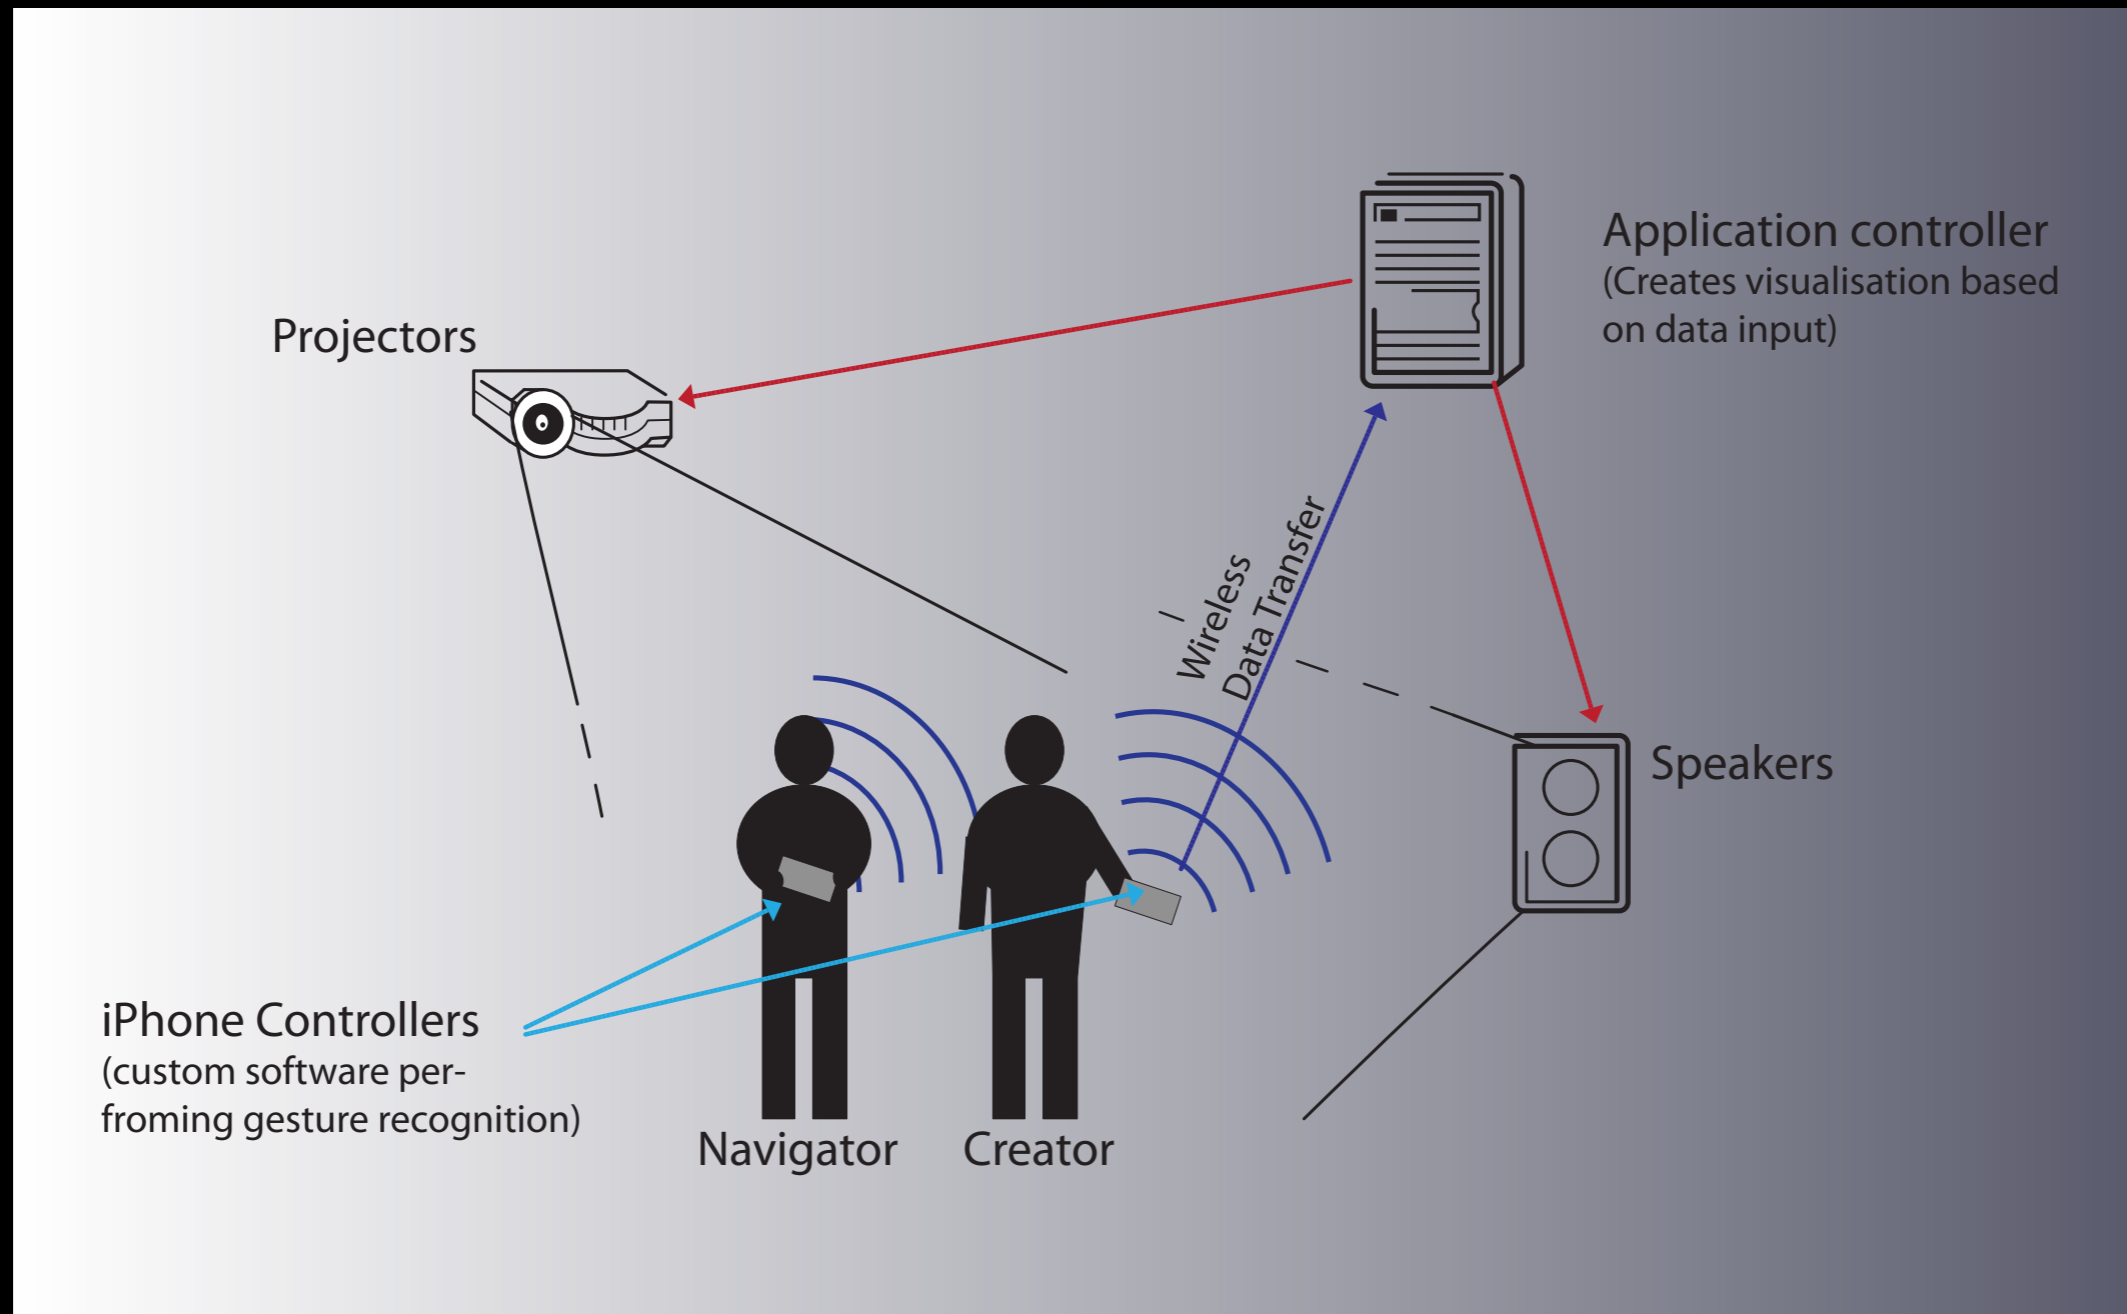

# Now

- Style now related to motion
  - Thickness, colours and sound
- Helped by work in 594CM

# Constructing Gesture

# Constructing Gesture

- Visualisation built in Processing
  - Realtime content creation and manipulation
- Two custom iPhone Applications written in Objective-C
  - Performs 2D and 3D gesture recognition

# Multiple users

- By separating roles of navigation and drawing, *Gesture* becomes more engaging, more fun

Draw

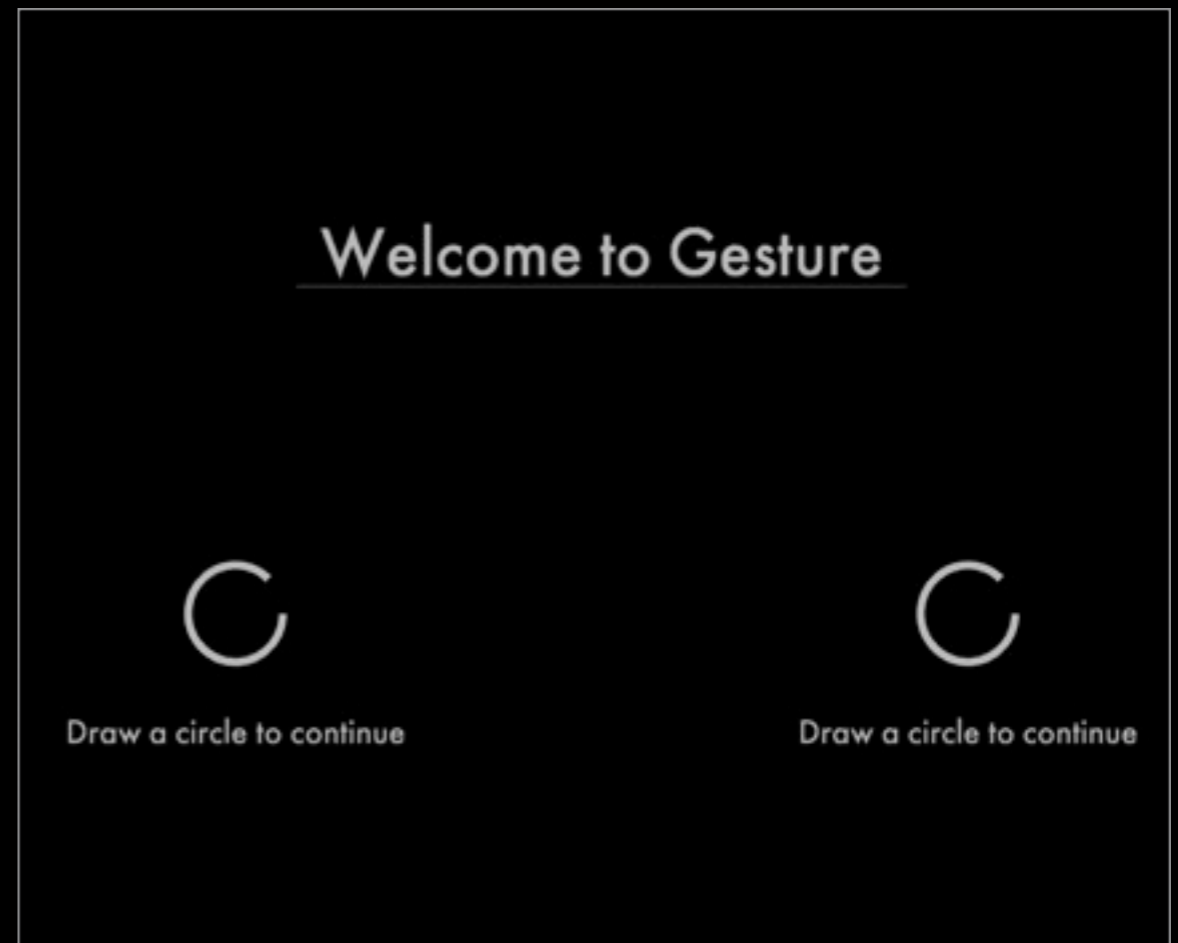

Navigate

- One iPhone draws the scene and controls the style
- One controls the camera - rotation, pan and zoom

# Providing instructions

- Visual clues were used (and should have been used more) to influence the user
  - Several people were seen attempting to draw on the wall

# Demonstration

# Conclusion

- *Gesture* highlights the potential of mobile devices to control of large scale visualisations
- Gesturing is a more natural, fun interaction style
- As the world become more mobile, we need a new interaction paradigm
  - Could *Gesture* point to it?
